VERSION 2.2.0 SEPTEMBER 2026

COLLECTIVE INTELLIGENCE GROUP

RELEASED NOTES IN XQ360

Two-factor sign in, faster and more accurate reporting, and improvements to vehicle set up and permissions

NEW **Two-factor authentication:** an emailed code at sign-in protects every account

IMPROVED **Reporting:** whole-report sorting, faster exports, accurate scheduled reports.

FIXED **Vehicle and site setup:** create vehicles in one go; sites save correctly.

New

Two-factor authentication

Signing in to XQ360 now takes one extra step: a single-use code sent to the user's email address, entered after their password. This is enabled by default for every account and cannot be turned off.

ACTION REQUIRED
Check that every XQ360 user has a current email address before the release, as is where their code will be sent.

- At sign-in, users enter their email address and password as usual, then the code that arrives by email.
- Codes can be resent from the sign-in page, and two-factor settings appear in the Security panel under My Account.
- After several incorrect codes the account is locked briefly; the message on screen says how long remains.
- Codes are sent by email only. Authenticator apps are not supported in this release.

Single sign-on customers are not affected; authentication continues to be handled by their own identity provider.

Improved

Report grids: sorting covers the whole report, page size is adjustable and totals reflect all results.
Exports: much faster on large fleets and follow the on-screen timezone.
Scheduled reports: dates, formats and language follow each customer's settings.
Pre-Op exports: critical questions counted individually to match the checklist.
Impact report: stays fast on high-volume sites.
Session timeout: returns every open tab to the login page.

Fixed

Vehicles: Create new vehicles with all tabs filled before the first save, and edit them right after.
Checklists: Work without an assigned model, unless the model feature is on.
Sites: Save correctly; customer contact details are optional.
CAN hours: Now update the current meter reading and the Service Check report.
Account email: Editable again, with a warning if the address is taken.
Service Check: Hour-meter labels translated in all languages.

Documentation

XQ360 API documentation is now available. A security and architecture overview is available on request from your account manager.
