VERSION 2.2.1 16 SEPTEMBER 2026

COLLECTIVE INTELLIGENCE GROUP

RELEASED NOTES IN XQ360

A new per-vehicle Seat Input setting for accurate idle timing, reliable saving of vehicle access and status settings, and a faster Fleet Dashboard.

NEW **Seat Input:** set per vehicle which signal resets the idle timer.

CHANGED **CAN BUS setting:** no longer decides the seat signal.

IMPROVED **Utilisation by Category:** totals on export tabs and the dashboard.

FIXED **Vehicle access and settings:** save reliably; Fleet Dashboard loads faster.

New

Seat Input - new vehicle setting

Each vehicle now states which signal tells XQ360 the operator is seated: **CAN Seat** or **Digital Input 4**. This is the signal that resets the idle timer.

KNOWN LIMITATION
The Seat Input label is translated into all supported languages, but its options (CAN Seat, Digital Input 4) appear in English in every language, like other equipment settings of this kind.

Changed

CAN BUS setting

No longer decides the seat signal, so a truck reporting over CAN no longer has its seat source chosen for it. It still sets how service hours accumulate: from the CAN meter reading or from ignition hours.

Improved

Utilisation by Category

Totals now appear on the export tabs and as a column on the dashboard.

Fixed

Saving vehicle access: works reliably; the "Failed to save vehicle access" error no longer appears and every selected vehicle is kept.
Revoking access to a single vehicle: now holds, even where a card still reached it through its department or model. Re-enabling restores access as expected.
VOR, Danger Tag and Full Lockout: changes are stored on the first save.
Fleet Dashboard: loads noticeably faster; each card loads once per Filter Data instead of repeatedly.
Impact report: stays responsive on large pages; severity axis labels stay readable at any scale and column width.
