

# XQ360 v2.2.0

Two-factor sign-in, faster and more accurate reporting, and a range of improvements to vehicle setup and permissions.

RELEASE

**v2.2.0**

DATE

**September 2026**

APPLIES TO

**XQ360 web platform**

## Two-factor authentication

Signing in to XQ360 now takes one extra step: a single-use code sent to the user's email address, entered after their password. This is enabled by default for every account and cannot be turned off.

- At sign-in, users enter their email address and password as usual, then the code that arrives by email.
- Codes can be resent from the sign-in page, and two-factor settings appear in the Security panel under My Account.
- After several incorrect codes the account is locked briefly; the message on screen says how long remains.
- Codes are sent by email only. Authenticator apps are not supported in this release.

### ACTION REQUIRED

Check that every XQ360 user has a current email address on their account before the release, as this is where their code will be sent. **Customers who sign in through single sign-on are not affected** — authentication continues to be handled by their own identity provider.

## Reporting

---

Report grids and scheduled reports have been reworked for speed and for accuracy on large fleets.

- **Sorting and paging now happen on the server.** Sorting a column sorts the whole report, not just the page on screen, and you can choose how many rows appear per page. Totals reflect the full result set.
- **Large exports are substantially faster** and now follow the timezone shown on screen, including when no date filter has been applied.
- **Scheduled email reports are correct per customer.** Date windows, number and date formatting and language follow each customer's own settings.
- **Run Now for subscriptions.** Send a subscribed report immediately from the Subscriptions tab, with the next and last run shown on the grid.
- **Pre-Op exports count critical questions individually** rather than once per check, so failure counts match the checklist.
- **The Impact report handles high-volume sites** without slowing down, on pages holding several hundred impacts.

## Access and permissions

---

- Website access groups now carry the full set of permissions previously available only in FleetFocus, giving finer control over what each role can see and change.
- A session timeout now returns every open tab to the login page, not only the tab in use.

## Setup and day-to-day fixes

---

- A new vehicle can be created with every tab completed before the first save, and can be edited again on the same page immediately after creation.
- Checklist questions work on vehicles that have no model assigned; a model is only required where the model feature is switched on.

- Adding a site saves correctly, and customer contact details are optional rather than mandatory.
- Hours reported directly by CAN vehicles reach the current meter reading and the Service Check report.
- Changing the email address on an account is a direct edit again, with a clear message if the address is already in use.
- Hour-meter labels on the Service Check report are translated in all supported languages.

## Documentation

---

- XQ360 API documentation is now available, along with a security and architecture overview on request.
